

Understanding weather and the weather forecast

Week 9 Clouds and the
Global Circulation

Terry Hart

The **Ferrel cell** is really a statistical average of the lows and highs in the zone of westerly winds.

Clouds

The first widely accepted classification – Luke Howard (1803) . It was regarded as the beginning of the formal science of meteorology and Howard is sometimes regarded as “the father of meteorology”

Originally had four primary terms (although terms could be combined):

- **Cirrus (‘curl of hair) for wispy clouds**
- **Stratus (‘layer’) for horizontal sheet-like clouds**
- **Cumulus (‘heap’) for puffy clouds**
- **Nimbus (‘rain’) for rain-bearing clouds**

Its success was due to use of the universal Latin and his adaptation of the biological (Linnaen) nomenclature – genera, species, varieties

1887 – modified to allow for height of cloud – ‘alto’ added for middle level clouds

1896 – first International Cloud Atlas

2017 revised International Cloud Atlas (World Meteorological Organization)

International Cloud Atlas Manual on the Observation of Clouds and Other Meteors (WMO-No. 407)

Welcome to the official site of the World Meteorological Organization's (WMO) International Cloud Atlas. This Atlas describes the classification system for clouds and meteorological phenomena used by all WMO Members. The classifications also describe meteorological meteors other than clouds – hydrometeors, lithometeors, photometeors, and electrometeors. [📄 Read More](#)

Definitions of clouds

What cloud is that?

Different types of deposits

<https://cloudatlas.wmo.int/en/home.html>

Cloud Genera

<i>Level</i>	<i>Genera</i>
High	Cirrus Cirrocumulus Cirrostratus
Middle	Altostratus Altostratus Nimbostratus
Low	Stratus Stratocumulus Cumulus Cumulonimbus

Cloud Height

Polar Regions

Temperate Regions

Tropical Regions

Common types of clouds in the troposphere

High level clouds

Cirrus

Cirrus (Ci)

- Most common high level clouds
- thin white wispy clouds often with hook shape
- strands in tufts called 'mares tails'
- composed of ice crystals formed from super-cooled water droplets
- appear in advance of a low pressure area .

Cirrostratus

Cirrostratus (Cs)

- Thin, sheet-like clouds composed of ice crystals
- can be 100 metres or more thick but are translucent
- sometimes only obvious by presence of halo around the sun or moon

Low level clouds

Stratus

- Featureless low altitude clouds with diffuse edges
- essentially above ground fog
- form when moist air lifts and expands,
- Can be associated with fronts and rain

Stratus and nimbostratus

Nimbostratus

- Thick sheets of low to middle level clouds
- associated with persistent rain

Stratocumulus

Stratocumulus

- Appear as lumpy shallow clouds
- may appear as rounded masses or rolls
- form in weak convective currents with an overlying inversion or stable layer that inhibits vertical development.

Middle level clouds

Altocumulus bands

Altocumulus castellanus

Altocumulus (Ac)

- Characterised by globular masses or rolls in layers or patches
- form by convection or wave propagation
- towering altocumulus castellanus may indicate impending thunderstorms

Why are there clouds?

EUMETSAT - A Year of Weather 2021

https://youtu.be/RlswRI_-6DY

Our annual year of weather visualisation rounds up the planet's weather in just under 10 minutes. With narration from EUMETSAT's Training Manager, Mark Higgins, we have highlighted the major storms across the globe and provided detail on what you can see from space.

Major storms are labelled from light yellow to red depending on their intensity.

It displays imagery from the geostationary satellites of EUMETSAT, the National Ocean and Atmospheric Administration (NOAA) in the US, the China Meteorological Administration (CMA) and the Japan Meteorological Agency (JMA). Merging our data, we are able to get these very comprehensive views of the entire planet

The visualisation is composed of a satellite infrared data layer, provided by Météo-France's Centre de Météorologie Spatiale, superimposed over NASA's 'Blue Marble Next Generation' ground maps, which change with the seasons.

The flickering in the video is due to the combination of data from the various satellites.
